

# WhatsApp Business API

sending messages (OTP), media, templates, interactives, and more.

## How To use the WhatsApp Business API in your Flutter application ?

First, I want to say that it is possible to use **WhatsApp Business API** for many tasks, such as sending contacts and the Media. However, I will explain how to use it to send a text message or to specify sending an OTP to verify the phone number registered with us.

in **3 Steps**

**1- Set Up the WhatsApp Business API**

**2- Get the From Number ID and Access Token**

**3- Use the WhatsApp package**

### step1: Set Up the WhatsApp Business API

- 1- Go to **Meta for Developers** and log in (or create a developer account).
- 2- In My Apps, create a new app and select **Business** as the app type.
- 3- On the app dashboard, under Add Products to Your App, find **WhatsApp** and click **Set Up**.

### step2: Get the From Number ID and Access Token

- 1- In the app dashboard, navigate to **Settings > WhatsApp > API Settings**, and Generate an **Access Token**.
- 2- In the WhatsApp section under Phone Numbers, locate the **From Number ID** for each linked number.

```
1 final String accessToken = 'EAAGp6aTb8.....'; // Put Your access token
2 final String fromNumberId = '1082772452xxxxx'; //Put Your registered WhatsApp Business number ID
```

### step3: Use the WhatsApp package

## 1- Install whatsapp Package

```
1 dependencies:
2   whatsapp: ^3.0.0
```

## 2- Generate a Random OTP

```
1  /* Generate a random 6-digit OTP
2  void generateOtp() {
3    final random = Random();
4    final otp = List<int>.generate(6, (_) => random.nextInt(10)).join();
5    generatedOtp = otp;
6    debugPrint('Generated OTP: $generatedOtp');
7  }
```

## 2- Send OTP via WhatsApp

```
1  /* Handle OTP generation and verification
2  void handleGenerateOtp() {
3    generateOtp();
4    whatsappService.sendOtp('919876543210', generatedOtp!);
5  }
```

step3: Use the WhatsApp package

## 4- Create class For WhatsAppService

```
1  return Scaffold(  
2    backgroundColor: Colors.white,  
3    appBar: AppBar(title: const Text("Send OTP")),  
4    body: Center(  
5      child: Padding(  
6        padding: const EdgeInsets.all(24),  
7        child: Column(  
8          crossAxisAlignment: CrossAxisAlignment.center,  
9          children: [  
10             ElevatedButton(  
11               onPressed: handleGenerateOtp,  
12               child: const Text("Send OTP"),  
13             ),  
14             TextField(  
15               onChanged: (value) => otpInput = value,  
16               decoration: const InputDecoration(labelText: "Enter OTP"),  
17             ),  
18             const SizedBox(height: 20),  
19             ElevatedButton(  
20               onPressed: handleVerifyOtp,  
21               child: const Text("Verify OTP"),  
22             ),  
23           ],  
24         ),  
25       ),  
26     ),  
27   );
```

step3: Use the WhatsApp package

## 5- Verify OTP

```
1  /* Verify the OTP entered by the user
2  void handleVerifyOtp() {
3      if (otpInput == generatedOtp) {
4          // OTP is correct
5          // Proceed to next step in your app
6          debugPrint('OTP is correct');
7      } else {
8          // Show error message to user
9          debugPrint('OTP is Incorrect');
10     }
11 }
```

## 6- Build the UI

```
1  ElevatedButton(
2      onPressed: handleGenerateOtp,
3      child: const Text("Send OTP"),
4  ),
5  TextField(
6      onChanged: (value) => otpInput = value,
7      decoration: const InputDecoration(labelText: "Enter OTP"),
8  ),
9  const SizedBox(height: 20),
10 ElevatedButton(
11     onPressed: handleVerifyOtp,
12     child: const Text("Verify OTP"),
13 ),
```
